MARKETING WESTERN NEW YORK AND PENNSYLVANIA GRAPES SUMMARY OF 1930 SEASON

By

R. L. Sutton, L. D. Spink, and A. L. Thomas

Washington, D.C.
July, 1931.

New York Leads in American Varieties

New York produces only grapes of American types, and has commonly been credited with being the largest producer of American varieties in the United States. Although Michigan generally ranks second to New York in point of production, this season the former is credited with a slightly larger crop than New York, Michigan's crop being estimated at 77,600 tons compared with 76,620 tons for New York.

The Chautauqua-Erie District

The Chautauqua-Erie District lies along the northeastern end of Lake Erie and extends from Eden, Erie County, in the north along the lake, crossing the State Line in Chautauqua County in the south and on into Erie County, Pennsylvania. This large body of water affords ideal protection to the growing of grapes in this district, comprising one of the largest acreages of American type grapes in the world. The Concord variety predominates and comprises 90% of the crop. During this season fully 65% of the State's total production came from the Chautauqua-Erie section.

Weather Conditions

Due to the continued warm and dry weather, the grapes in the Chautauqua-Erie District matured earlier than in 1929. The weather had been hot and dry during July and August and affected the yield of all vineyards, the percentage of loss in yield being much more apparent in the vineyards that were poorly cultivated, fertilized and sprayed. Although the weather materially affected the yield, size of berries and compactness of bunches, the quality of the grapes was the best ever grown in this section, being well colored, free from insects and disease, and the sugar content running over 20%.

A snow storm, beginning on October 18 and lasting two days, covered the entire grape belt with from two to three feet of snow, the heaviest snow-fall in this section being between Dunkirk and Silver Creek, but all parts of the belt had enough to prevent picking for some time. The fall was lightest at North East, Pa., where about half the crop was still unharvested. This storm greatly hampered picking, especially around Silver Creek, where even bob sleds were used by some growers to take out the grapes. Growers found, as a result of the storm, that the fruit shelled more easily and that stems had become brittle. Also, considerable damage was done to the fruit by birds. One beneficial effect of the storm was the plumping of the berries and giving them a better flavor.

Prices

The low cash price to growers of \$30.00 to \$35.00 per ton at the opening of the season, caused the growers to be reluctant about picking, and although the juice plants opened, the tonnage they received was not sufficient for capacity pressing. Early in the season three important juice plants agreed to pay a minimum price of \$40.00 per ton for U. S. No. 1 juice grapes of the Concord variety. The belt was placarded by a leading juice company offering \$40.00 per ton for this stock. This stimulated activity and tended to stabilize the price. However, those not belonging to the C-E Association or having contracts with juice companies, soon felt the effects of lower prices, as grapes from Michigan, California, and even those from the Central Lakes District of New York were selling in the terminal markets for less.

The general trend for the season for Concords, U. S. No. 1, juice stock in 12-quart Climax baskets was \$37.00 to \$48.00 per ton, with the price of \$40.00 to \$45.00 per ton predominating. Toward the end of the season the prevailing price was \$50.00 to \$55.00 per ton, with a few cars reaching the high level of \$60.00 per ton.

The bushel pack of this variety ranged from \$36.00 to \$45.00, the greater portion moving at from \$38.00 to \$40.00 per ton. The Niagara variety in the 12-quart Climax baskets ranged from \$45.00 to \$55.00, mostly selling for \$50.00 per ton. The 2-quart Climax basket, table stock, sold for 11¢ to 13¢, mostly 12¢. The 14-quart Climax basket sold for 19¢ and the cartons of twelve 2-quart baskets sold for \$1.50 to \$1.85, mostly \$1.65.

Packing Houses

Packing houses packing the 2-quart Climax baskets and the carton of twelve 2-quart baskets of table grapes did not operate long this season, as the market did not warrant the extra labor and expense of the package. The bushel baskets, which are used so much in the Central Lake section, and which were well thought of in the C-E District last year, met with nearly a flat refusal this year, and the price reductions of from \$3.00 to \$10.00 per ton were accepted for cars loaded with this package. The 12-quart Climax basket was the most popular package used. The tray was also used to some advantage.

The grapes in the vicinity of North East, Pa., were of better quality than in Chautauqua County, possibly for the reason that the fruit was not as dead ripe at time of shipment.

Juice Plants

Juice plants used not only a larger percentage of the crop this year, but also pressed a greater tonnage than ever before. It is estimated that 44% of the crop was disposed of in this manner, including also some production of other lines of grape products, such as pie-fillers and jelly, and uses for the dried pumice from which the seeds have been removed.

Refrigeration

Due to the low prices, shippers and receivers were not inclined to ice the cars or pre-cool them, rather taking chances which proved disastrous, due to the continued warm weather. Nearly all shippers had some trouble with arrivals being leaky, some accepting allowances, others having to divert shipments that were later refused. Many old receivers did not handle grapes, and new ones took chances and with the unsettled market faced a loss and were obliged to take advantage of anything in the way of refunds or adjustments.

Few grapes were stored in the belt by shippers, although some were stored by them at the terminal markets and sold to good advantage during the snow storm and at the end of the season.

Trucking

It is impossible to check the amount of grapes trucked out of the belt. In many cases growers were able to market their grapes in this manner at a greater profit than if handled through the usual agencies, especially if trucked by the grower to a nearby market. Truckers were fairly active in the belt all the season, taking grapes not only from the vineyards, but also from the cars which the shippers had partly or even completely loaded. With the uncertain terminal markets, shippers were glad to effect a cash sale wherever possible. Trucking from the Brocton section was heavier than from the North East section.

Sale By Roadside Stands

One factor that became of great importance to growers this year, was that the early grapes of various varieties were packed in baskets and sold to tourists from roadside stands. Some growers are taking up variety plantings so as to be able to pack the tri-colored table grape packages, and are even considering packing the different varieties in lugs so that purchasers may have a box of each of three or four varieties and colors.

State Experiment Station

Through the branch State Experiment Station, located at Fredonia, much constructive work was accomplished along the lines of disease prevention, fertilizing, spraying, cultivation, keeping qualities and varieties of grapes.

Outstanding Features Of The 1930 Season

The outstanding features for the 1930 season were: an unusually warm fall, adecreased crop of high quality, largest percentage of the crop (and also largest total tonnage) ever pressed, an abundance of labor for picking and packing, ample supply of baskets and cars, and the very apparent necessity of concerted action on the part of growers, shippers and juice plants to stabilize the grape industry for a section that is favorable to the growing of high quality stock. Federal and State shipping point inspection was also a factor in the movement of the crop and was considered of great advantage.

Grape Crop In Chautauqua-Erie Section - Season 1930 (Taken from the Grape Belt issue of December 30, 1930)

Tarible (1907) (1908) A Discontinuing (1908) (1908) (1907) (1907) (1908) (1907)	Total Cars	Tons Net Weight Fruit
Shipped out of belt by rail	1,834	20,791
Delivered to juice plants by truck Trucked out of belt (estimate) Used and sold locally (estimate)		21,047
TOTAL NET WEIGHT OF FRUIT, 1930 SEASON	*	47,71
Estimated price per ton, \$35.00 . VALUE OF CROP		\$1,669,955

A total of 51,169 tons of grapes were estimated to have been produced in the belt for the season of 1929. The production in Pennsylvania was com-

THE FINGER LAKES DISTRICT

The second district of importance is located adjacent to the Finger Lakes, especially Lakes Keuka, Canandaigua and Seneca, and includes the counties of Ontario, Yates, Seneca, Steuben, and Schuyler. This territory, sometimes known as the Central Lakes District, probably supplied about 25% of the State's tonnage. The Concord is the most important variety, but in this section the Niagara, Catawba, Delaware and Worden also assume some importance.

F.O.B. Prices

Prices averaged low during this past season. Opening prices from the Finger Lakes on September 22 were at \$40 per ton for Concords and Niagaras in bushel baskets. The same amount per ton was realized on first shipments in 12-qt. climax baskets. As a rule the 12-qt. climax baskets averaged about \$5 per ton higher than the bushel baskets. "Ponies" or 2-qt. climax baskets started out at 122-13¢ for Concords and Niagaras, and within a few days settled at 11-12¢ for carload f.o.b. sales. Ponies were loaded mostly straight Concords. During October, when shippers in 1929 were selling at \$50-60 per ton, the prices this season ranged \$35-45. With the crop beginning to clean up, the prices started to advance about the middle of October. During the last ten days of the deal, f.o.b. quotations fluctuated from \$40 to \$65 per ton. The top price was as high as any reached during 1929, but such is of no importance when it is considered that top quotations were reached for probably only one or two cars, whereas higher prices were sustained throughout the season of 1929. Grapes from the Finger Lakes usually sold somewhat higher than those from the Chautauqua-Erie District.

Quality of Fruit

The quality of the fruit was exceptionally good this season. The juice plants are not so active in the Finger Lakes District as in the Chautauqua-Erie section. Increase in duty imposed by Canada on grape pulp (crushed grapes) curtailed the movement in that direction. There had already been in effect a heavy duty on fresh grapes into Canada.

Competition with California

The vastness of the California crop caused the eastern markets to be greatly absorbed in the handling of grapes from that State. It is undoubtedly true that California Tokays, Malagas, and Thompson Seedless acquired much of the "table" trade which could readily have been satisfied with New York Concords.

THE HUDSON VALLEY DISTRICT

The Hudson Valley District comprises the third center of production. Columbia, Dutchess, Ulster, and Orange Counties cover most of the territory. Although this section is of less importance than the other two, the carlot shipments do not reflect its tonnage since the majority of the crop moves either by truck or boat.

U. S. STANDARDS FOR AMERICAN (EASTERN TYPE) BUNCH GRAPES (1930)

GRADES

U. S. Fancy Table Grapes shall consist of grapes of one variety which are well colored, mature, firmly attached to capstems, not shattered, split, crushed, dried, wet or soft; which are free from mold, decay, mildew, berry moth, russeting, hail, and from damage caused by freezing, disease, insects, or other means. Not less than 50 per cent of the bunches in any container* shall be compact and the remainder shall be fairly compact. Bunches shall not be excessively small excepting that compact portions of bunches consisting of no less than five (5) berries may be used to fill open spaces between whole bunches.

Berries of the Concord, Worden, Champion and other varieties of similar size shall have a minimum diameter of not less than nine-sixteenths (9/16) of an inch measured through the widest portion of the cross section.

In order to allow for variations incident to proper grading and handling, not more than a total of 10%, by weight, of the berries in any container* may be below the requirements of this grade but not more than 5% shall be allowed for serious damage. Of this tolerance for serious damage not more than two-fifths or 2% shall be allowed for dried berries and not more than one-fifth or 1% may be affected by mold or decay. In addition, not more than 5%, by weight, of the bunches in any container* may be straggly, and not more than one-tenth (1/10), by weight, of the bunches in any container* may have more than 10% of berries which do not meet the size requirements.

U.S. No. 1 Table Grapes shall consist of grapes of one variety which are fairly well colored, mature, firmly attached to capstems, not shattered, split, crushed, dried, wet or soft, which are free from mold, decay, berry moth, and from damage caused by mildew, russeting, hail, freezing, disease, insects or other means. Not less than 85 per cent of the bunches in any container* shall be fairly compact.

Berries of the Concord, Worden, Champion and other varieties of similar size shall have a minimum diameter of not less than nine-sixteenths (9/16) of an inch measured through the widest portion of the cross section.

In order to allow for variations incident to proper grading and handling, not more than a total of 10%, by weight, of the berries in any container* may be below the requirements of this grade, but not more than 5% shall be allowed for serious damage. Of this tolerance for serious damage not more than two-fifths or 2% shall be allowed for dried berries and not more than two-fifths or 2% may be affected by mold or decay.

In addition not more than one-tenth (1/10) by weight, of the bunches in any container* may have more than 10% of berries which do not meet the size requirement.

U. S. No. 1 Juice Grapes shall consist of grapes of one variety which are fairly well colored, mature, firmly attached to capstems, not shattered, split, crushed, dried, wet or soft, which are free from mold, decay, berry moth, and from serious damage caused by mildew, russeting, hail, freezing, disease, insects or other means. Not less than 60% of the bunches in any container* shall be fairly compact.

In order to allow for variations incident to proper grading and handling, not more than a total of 15 per cent, by weight, of the berries in any container* may be below the requirements of this grade but not more than 6 per cent shall be allowed for berries which are seriously damaged and not more than one-half of this amount or 3 per cent may be affected by mold or decay.

MIXED VARIETIES

Any lot of grapes consisting of more than one variety which meets all other requirements of "U.S. Fancy Table", "U.S. No. 1 Table" or "U.S. No. 1 Juice" may be designated as "U.S. Fancy Table Mixed", "U.S. No. 1 Table Mixed", "U.S. No. 1 Juice Mixed."

Unclassified. Grapes which are not graded in conformity with the foregoing grades may be designated as "Unclassified."

*APPLICATION OF TOLERANCES. Although the tolerances specified for the various grades are placed on a container basis, not more than one-fourth of the containers in any lot may be permitted to exceed the tolerances specified, by not more than one-half of the amount allowed; provided, that the entire lot shall average within the tolerances specified; provided, further, that no container shall have more mold or decay than the amount specified in the tolerance.

DEFINITIONS OF TERMS

As used in these grades:

"Mature" means that the grapes are juicy, palatable and have reached that stage of development at which the skin of the berry easily separates from the pulp. Frozen or slightly frosted stock should not be confused with mature stock.

"Well colored" means that the berries shall show full color characteristic of the variety.

"Fairly well colored" means that not less than 75 per cent, by weight, shall show full color characteristic of the variety. 25 per cent, may show partially or poorly colored berries which are not characteristic of immature berries.

"Shattered berries" means berries which have separated from the bunch.

"Compact bunches" means well filled bunches, with no open spaces.

"Fairly compact" means that the bunches are well filled but that the berries are not closely spaced as in "compact bunches."

"Damage" means any injury which materially affects the appearance or the edible or shipping quality. Mildew which affects the appearance of the berries shall be considered as damage, but berries shall not be regarded as damaged by mildew which are firmly attached to the stems and which have only slight traces of mildew on the inside of the bunch where it does not affect the appearance of the berries.

"Serious damage" means that the defects taken singly or collectively seriously affect the market quality.

"Straggly means a decidedly open bunch with large open spaces and very few berries. Small immature shotberries characteristic of the Worden variety should be disregarded unless they are excessive in number and detract materially from the appearance of the lot.
